

Inline turning unit DS.02

For turning stacks of brochures or catalogues

When packing in telescopic cartons the turning unit DS.02 takes over the turning of the stacks after the bottom of the carton is drawn over. The workflow is structured and rationalized.

For different jobs in the finishing process of paper stacks, eg. sticking labels on the front or reverse side, in order to get the title up for mailing or when packing of printed materials in telescopic cartons a turning of the pile is required. Manual handling is time consuming and labour intensive and can put a strain on employees. Depending on the product thickness and output of the production line the personnel requirement for a continuous workflow is enormous.

The Dürselen DS.02 turning unit completes this operation inline. The compactly designed, 700

stacks per hour system can be easily integrated into any production workflow and if turning is not required, it can be used as a transport unit.

- formats from 210 x 210 mm up to 250 x 350 mm
- 700 stacks per hour
- stack heights of 105 – 200 mm without any setup time
- through self-lubricating bearings, the machine is trouble-free and requires almost no maintenance
